在笔者上一篇文章 《驱动开发:应用DeviceIoContro开发模板》简单为大家介绍了如何使用

DeviceIoContro 模板快速创建一个驱动开发通信案例,但是该案例过于简单也无法独立加载运行,本章将继续延申这个知识点,通过封装一套标准通用模板来实现驱动通信中的常用传递方式,这其中包括了如何传递字符串,传递整数,传递数组,传递结构体等方法。可以说如果你能掌握本章模板精讲的内容基本上市面上的功能都可以使用本方法进行通信。

首先定义驱动功能号和名字,提供接口给应用程序调用。

IOCTL_IO_TEST 传递整数: 派遣例程用于传递整数类型,首先客户端通过 DriveControl.IoControl 将数据通过变量 input 传入到内核中,并等待返回,如果返回了结果则 outpot 里存储的就是返回结果,ref_len则是返回长度。

看看客户端如何接收这个数据的传递。

```
// 传入x参数,返回到y中,返回长度为z

DWORD input = 100, output = 0, ref_len = 0;
DriveControl.IoControl(IOCTL_IO_TEST, &input, sizeof(input), &output, sizeof(output), &ref_len);

std::cout << "传入参数: " << input << std::endl;
std::cout << "输出参数: " << output << std::endl;
std::cout << "参数长度: " << ref_len << std::endl;
```

对于驱动中我们不需要做任何操作只需要通过 memcpy(&dw, pIoBuffer, sizeof(DWORD)) 得到缓冲区内的数据,对该数据 dw++ 递增,最后通过 memcpy(pIoBuffer, &dw, sizeof(DWORD)) 再将数据写回到应用层。

```
case IOCTL_IO_TEST:
{
    DWORD dw = 0;

    // 得到输入参数
    memcpy(&dw, pIoBuffer, sizeof(DWORD));

// 对输入参数进行处理
    dw++;

// 设置输出参数
    memcpy(pIoBuffer, &dw, sizeof(DWORD));
```

```
// 返回通信状态
status = STATUS_SUCCESS;
break;
}
```

IOCTL_IO_Array 传递数组: 派遣例程用于传递数组类型,首先定义数组 MyArray 将数组 首地址 以及 数组长度 传递到内核中,内核收到首地址以及长度后通过 uInSize / sizeof(int) 得到每一个元素的长度,最后循环输出元素即可。

```
// 应用层
// -----
// 传入数组
int MyArray[10] = \{ 1, 2, 3, 4, 5, 6, 7, 8, 9, 0 \};
int array_count = 10 * sizeof(int);
DriveControl.IoControl(IOCTL_IO_Array, &MyArray, array_count, 0, 0, 0);
// -----
// 内核层
// -----
// 输出一个数组
case IOCTL_IO_Array:
   int *ArrayPtr = (int *)pIoBuffer;
   int count = uInSize / sizeof(int);
   for (int x = 0; x < count; x++)
      DbgPrint("计数器: %d \n", ArrayPtr[x]);
   }
   status = STATUS_SUCCESS;
   break;
}
```

IOCTL_IO_STRUCT 传递结构: 结构体的传输与数组类似,仅仅只是在接收到数据后对其进行一定的转换即可,应用层只需要 DriveControl . IoControl 发送 send_ptr 指针并等待回传recv_ptr 即可,最后将得到的结果直接输出,而内核层收到数据后仅仅也只需要 (MyData *)ploBuffer 将数据转为一个指针即可操作这片区域,当操作完成时以同样的方式 memcpy(ploBuffer, &send_data, sizeof(MyData))`返回一个结构体给应用层。

```
// 应用层
// 应用层
// 传入一个结构体,返回结构体
MyData send_ptr, recv_ptr;
DWORD dwSize = 0;
memset(send_ptr.szUname, 0, 1024);
```

```
memset(recv_ptr.szUname, 0, 1024);
send_ptr.uuid = 1001;
strcpy(send_ptr.szUname, "lyshark");
// 派遣命令
DriveControl.IoControl(IOCTL_IO_STRUCT, &send_ptr, sizeof(send_ptr), &recv_ptr,
sizeof(recv_ptr), &dwSize);
// DeviceIoControl(hDevice, IOCTL_IO_STRUCT, &send_ptr, sizeof(send_ptr),
(LPVOID)&recv_ptr, sizeof(recv_ptr), &dwSize, 0);
std::cout << "内核返回数据: " << recv_ptr.uuid << std::endl;
std::cout << "内核返回数据: " << recv_ptr.szUname << std::endl;
std::cout << "内核返回长度: " << dwSize << std::endl;
// 内核层
// -----
// 测试传递结构体
case IOCTL_IO_STRUCT:
{
   MyData recv_data, send_data;
   // 获取到应用层传入的数据
   MyData *ptr = (MyData *)pIoBuffer;
   DbgPrint("获取序列号: %d \n", ptr->uid);
   DbgPrint("获取名字: %s \n", ptr->szBuf);
   */
   // 获取数据
   memcpy(&recv_data, pIoBuffer, sizeof(MyData));
   DbgPrint("[驱动读入]: UID: %d --> Name: %s \n", recv_data.uuid,
recv_data.szUname);
   // 发送数据
   memset(send_data.szUname, 0, 1024);
   send_data.uuid = 1002;
   strcpy(send_data.szUname, "lyshark");
   memcpy(pIoBuffer, &send_data, sizeof(MyData));
   status = STATUS_SUCCESS;
   break;
}
```

如上就是内核层与应用层的部分代码功能分析,至于传递字符串也很简单大家自己学习下即可掌握,接下来我将完整代码分享出来,大家可以自行测试效果。

驱动程序 WinDDK. sys 完整代码;

```
// 署名权
// right to sign one's name on a piece of work
```

```
// PowerBy: LyShark
// Email: me@lyshark.com
#define _CRT_SECURE_NO_WARNINGS

   DriveControl.Open("\\\.\\WinDDK");
   // 无参数输出
   DriveControl.IoControl(IOCTL_IO_Msg, 0, 0, 0, 0, 0);
   // 传入x参数,返回到y中,返回长度为z
   DWORD input = 100, output = 0, ref_len = 0;
   DriveControl.IoControl(IOCTL_IO_TEST, &input, sizeof(input), &output,
sizeof(output), &ref_len);
   std::cout << "传入参数: " << input << std::endl;
   std::cout << "输出参数: " << output << std::endl;
   std::cout << "参数长度: " << ref_len << std::endl;
   // 传入数组
   int MyArray[10] = \{ 1, 2, 3, 4, 5, 6, 7, 8, 9, 0 \};
   int array_count = 10 * sizeof(int);
   DriveControl.IoControl(IOCTL_IO_Array, &MyArray, array_count, 0, 0, 0);
   // 传入一个结构体,返回结构体
   MyData send_ptr, recv_ptr;
   DWORD dwSize = 0;
   memset(send_ptr.szUname, 0, 1024);
   memset(recv_ptr.szUname, 0, 1024);
   send_ptr.uuid = 1001;
   strcpy(send_ptr.szUname, "lyshark");
   // 派遣命令
   DriveControl.IoControl(IOCTL_IO_STRUCT, &send_ptr, sizeof(send_ptr), &recv_ptr,
sizeof(recv_ptr), &dwSize);
   // DeviceIoControl(hDevice, IOCTL_IO_STRUCT, &send_ptr, sizeof(send_ptr),
(LPVOID)&recv_ptr, sizeof(recv_ptr), &dwSize, 0);
   std::cout << "内核返回数据: " << recv_ptr.uuid << std::endl;
   std::cout << "内核返回数据: " << recv_ptr.szUname << std::endl;
    std::cout << "内核返回长度: " << dwSize << std::endl;
```

```
// 传入一个字符串,返回一个字符串
   char szString[256] = \{0\};
   char szRecvPtr[256] = { 0 };
   // 派遣命令
   strcpy(szString, "hello lyshark");
   DriveControl.IoControl(IOCTL_IO_String, &szString, sizeof(szString), &szRecvPtr,
sizeof(szRecvPtr), &dwSize);
   std::cout << "内核返回数据: " << szRecvPtr << std::endl;
   // 关闭符号链接句柄
   CloseHandle(DriveControl.m_hDriver);
   // 停止并卸载驱动
   DriveControl.Stop();
   DriveControl.Remove();
   system("pause");
   return 0;
}
```

手动编译这两个程序,将驱动签名后以管理员身份运行 lyshark.exe 客户端,此时屏幕中即可看到滚动输出效果,如此一来就实现了循环传递参数的目的。
